The global Hydrostatic Bearing Linear Actuators market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Hydrostatic bearing linear actuators are a type of linear actuator that utilizes hydrostatic bearings for support and motion control. Hydrostatic bearings use a fluid layer, typically oil or air, to create a thin film of lubrication between surfaces, reducing friction and allowing for smooth and precise linear motion. These actuators are commonly used in high-precision applications where accuracy, stability, and load capacity are critical. Hydrostatic bearing linear actuator does not use any sealing ring, and uses the hydrostatic bearing system to realize the automatic centering, sealing and guiding of the piston rod and the cylinder body, and can run without friction and hysteresis when the rated load is reached. When working, no matter whether the supported element is in a static state or in a moving state, there is a layer of lubricating oil film that separates the working surfaces of the friction pair, so it is suitable for test tasks that require higher control and measurement accuracy.
