## Abstracts

According to our (Global Info Research) latest study, the global Hydroxyethyl Methylcellulose (HEMC) market size was valued at US\$ 124 million in 2025 and is forecast to a readjusted size of US\$ 181 million by 2032 with a CAGR of 5.5% during review period.

Hydroxyethyl methylcellulose (HEMC) is a non-ionic water-soluble cellulose ether obtained by etherification modification with natural cellulose as the skeleton. Hydroxyethyl and methyl substituents are simultaneously introduced into the molecule, making it easy to disperse and dissolve in cold water and form a solution with a certain viscosity. It has the functions of thickening, water retention, film formation, suspension stability, and improving rheology; Therefore, HEMC is widely used as a building material additive, such as tile adhesive, plastering mortar and water retaining thickener in self leveling, as well as in water-based coatings and lotion, daily chemical washing and personal care formulas, as well as some oilfield chemicals and industrial systems, to improve workability, anti sagging and system stability, and to match the requirements of different applications for opening time, thixotropy and water retention through the degree of substitution and viscosity grade. In 2025, global Hydroxyethyl Methylcellulose (HEMC) production reached approximately 21.49 K MT, with an average global market price of around US\$ 5,620 per MT.

Hydroxyethyl methylcellulose has an annual production capacity of 300000 tons and a gross profit margin of around 25%.

The upstream mainly comes from the basic chemical and non-ferrous metal chains, with key raw materials including high-purity magnesium ingots or magnesium powder,

anhydrous methanol, auxiliary materials and supporting materials including activation aids and process aids that suppress side reactions, inert gases such as nitrogen or argon, desiccants and dehydration system consumables, solvent recovery systems, filtration media and moisture-proof lining packaging materials. At the same time, it relies heavily on corrosion-resistant reaction vessels, closed filtration drying and explosion-proof facilities.

Downstream, it is mainly used as an alkaline reagent or methoxylation reagent in organic synthesis and fine chemicals, such as condensation and ester exchange reactions in the synthesis of pharmaceutical and pesticide intermediates, transesterification catalysis in the manufacture of special esters and additives, and as a magnesium source or precursor in some materials and catalytic systems. Its customers are mostly pharmaceutical and chemical plants, agrochemical enterprises, fine chemical plants, and reagents and distribution channels with anhydrous inert operation capabilities.

The cost of raw materials usually accounts for 55% to 75% of the total cost, manufacturing expenses account for about 10% to 18%, packaging and hazardous chemical logistics account for about 6% to 15%, quality inspection and document system and manual management account for about 6% to 12%, and environmental safety compliance and loss disposal account for about 3% to 8%.
