Hypercalcemia is a condition caused by above normal levels of calcium in the body, with serum calcium level greater than 2.6 mmol/L. It is a life threatening metabolic disorder associated with neoplastic diseases and occurs in 10% to 20% of all adults suffering from cancer; particularly lung and breast cancer, and myeloma.

Scope of the Report:

This report studies the Hypercalcemia Treatment market status and outlook of Global and major regions, from angles of players, countries, product types and end industries; this report analyzes the top players in global market, and splits the Hypercalcemia Treatment market by product type and applications/end industries.

The increasing instances of surgical procedures, such as hip and knee replacements, will increase the risk of hypercalcemia and drive the growth prospects for the global hypercalcemia treatment market in the upcoming years. The study also shows that the prevalence of broken bone repair surgeries, cardiovascular procedures, percutaneous coronary interventions, joint replacement surgeries, knee replacement surgeries, hip replacement surgeries, and cases of coronary artery bypass grafting will increase the chances of developing hypercalcemia post surgeries. Consequently, the demand for hypercalcemia treatment drugs will also increase during the predicted period.

The growing preference for combination therapy is estimated to drive the growth prospects for the global hypercalcemia treatment market until the end of 2023. The adoption rate and preference for hypercalcemia drugs is increasing in developed countries with the growing use of hypercalcemia drugs in combination with other

therapies. For instance, researchers have evaluated the use of combination drugs, which includes pamidronate and calcitonin. Additionally, it has also been observed that the reduction in elevated serum parathyroid hormone (PTH) levels and the improvement of bone mineral density can be achieved using denosumab (DMAb) and calcitriol. Such combination therapies will lead to a new therapeutic strategy to reverse severe bone loss due to therapy-resistant SHPT in individuals with CKD.
