In some people, the body's mechanism for cooling itself is overactive — so overactive that they may sweat four or five times more than is necessary, or normal. When sweating is this extreme it can be embarrassing, uncomfortable, anxiety-inducing, dangerous, and disabling. It often disrupts all aspects of a person's life, from career choices and recreational activities to relationships, emotional well-being, and self-confidence. This kind of excessive sweating is a serious medical condition. It's called hyperhidrosis and it afflicts millions of people around the world (nearly 5% of the world's population). But, due to lack of awareness among sufferers and lack of education

among medical professionals, most people are never diagnosed or relieved of their symptoms.
