According to our (Global Info Research) latest study, the global Hyperkalemia Treatment market size was valued at USD 555.6 million in 2023 and is forecast to a readjusted size of USD 1991.1 million by 2030 with a CAGR of 20.0% during review period.

Hyperkalemia is a diseases in which levels of potassium are higher than normal level (3.5 and 5.0 mmol/L) in blood serum. Kidneys are responsible for managing potassium balance in the body by regulating its excretion as well as its intake. A person is prone to develop hyperkalemia when the consumption of potassium exceeds that of kidneys' potential to excrete it. The right amount of potassium and sodium in the body play a vital role in normal functioning of the myocardium.

Hyperkalemia can occur due to congestive heart failure, chronic kidney disease, or diabetic kidney disease. The condition can also occur when a patient receives renin-angiotensin-aldosterone system inhibitors (RAAS) in kidney disease. Abnormal levels of potassium can lead to irregular heartbeats, which can be fatal. Hyperkalemia is diagnosed by kidney functioning test, creatinine blood test, blood tests, and glucose monitoring.
