Abstracts

Hyperpigmentation is a skin condition in which patches of skin becomes darker than the surrounding skin. Hyperpigmentation is characterized by the age spots, brown spots, and freckles. Skin darkening occurs as a result of melanin augmentation beneath the epidermis layer of the skin.

According to our (Global Info Research) latest study, the global Hyperpigmentation Treatment Devices market size was valued at USD 387 million in 2022 and is forecast to a readjusted size of USD 660.7 million by 2029 with a CAGR of 7.9% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

There are various device-based methods for treating hyperpigmentation condition, which includes laser-based methods, intense pulsed light photo rejuvenation, sub surfacing non-ablative lasers, microdermabrasio, and radiofrequency devices. These devices offer non-surgical treatment option for curing hyperpigmentation and associated diseases such as sun spots, scars etc. Most of these devices are used for different skin problems including severe form of hyperpigmentation, in which Others options such as topical and pharmaceutical agents do not show promising results. Each device type has unique way of treating hyperpigmentation condition. Laser devices are most dominantly used in current scenario over Others devices due to less side effects and effective results when compared to Others devices.
