Abstracts

A data center is a centralized facility used for data computing, processing, and storage. A data center consists of networking equipment; high-performance servers; storage arrays; and supporting services, such as powering and cooling solutions. A hyperscale data center is more like a customized data center that has wider racks and requires more space compared with a traditional data center. Hyperscale data centers are designed based on the storage requirement. With the evolution of cloud computing and increased use of big data analytics, there is a greater need to construct more data centers that can cater to the growing computing requirements of enterprises.
