Abstracts

Missiles are self-propelled precision-guided munition systems and essential part of a country's firearm inventory. They constitute of four system components, which are targeting or missile guidance system, flight system, engine, and warhead. Missiles are classified as subsonic, supersonic, and hypersonic systems depending on the speed at which they travel. Subsonic systems travel at a speed of Mach 0.8 and are known for dodging obstacles and being fuel efficient. They also have higher payload-carrying capacity. The technology for the development of subsonic missiles is quite matured, and countries have capitalized the building of such systems.

Scope of the Report:

This report focuses on the Hypersonic Missiles in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

The latest trend gaining momentum in the market is emergence of scramjet technology. Propulsion system plays a critical role in determining the range, payload, and speed of a missile. The major propulsion systems currently used in rockets and missiles are turbofans, turbojets, and ramjets. Supersonic systems, which travel at a speed of Mach 2-4, run on the ramjets technology. However, in the recent years, there is an increasing need for rockets with higher speeds. This has led to the development of a new propulsion system called scramjet, or Supersonic Combustion Ramjet.

One of the major factors hindering the growth of this market is Ambiguities with hypersonic missiles. The development of hypersonic missiles is clouded with several

concerns. Most of it refers to the whether a conventional or nuclear warhead is being used. Hypersonic missiles, when fitted with nuclear warheads, can be fatal to the target enemy country. It can also cause nuclear winter that could last for a very long time after the initial attack and eventually leave the area inhabitable. Another ambiguity lies with respect to the target.

The worldwide market for Hypersonic Missiles is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
