## Abstracts

The global Hyperspectral Filter market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Hyperspectral filter is a filter that can selectively transmit light in a specific wavelength range and can be used in spectral imaging, optical sensors, spectrum analyzers and other fields. Unlike traditional filters, hyperspectral filters can pass through multiple discrete wavelength ranges rather than just one fixed wavelength. Hyperspectral filters are usually composed of multiple narrow-band filters, each narrow-band filter only transmits light in a specific wavelength range. By combining different narrowband filters, multiple different wavelength ranges can be transmitted to obtain hyperspectral images.
