Abstracts

Hyperspectral imaging, like other spectral imaging, collects and processes information from across the electromagnetic spectrum. The goal of hyperspectral imaging is to obtain the spectrum for each pixel in the image of a scene, with the purpose of finding objects, identifying materials, or detecting processes. There are two general branches of spectral imagers. There are push broom scanners and the related whisk broom scanners, which read images over time, and snapshot hyperspectral imaging, which uses a staring array to generate an image in an instant.

Scope of the Report:

This report focuses on the Hyperspectral Imaging Systems in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. In 2018, North America is expected to account for the largest share of the global market. However, the Asia-Pacific region is expected to grow at the highest CAGR during the forecast period. The market for hyperspectral imaging systems is expected to grow in emerging economies in APAC as they have a growing number of manufacturing bases. These cameras are used for homeland surveillance, spaceborne applications, agriculture and mineral surveillance, and other research activities requiring constant spectral vigilance.

The worldwide market for Hyperspectral Imaging Systems is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
