Abstracts

According to our (Global Info Research) latest study, the global Hyperspectral Imaging Systems market size was valued at USD 12 million in 2023 and is forecast to a readjusted size of USD 18 million by 2030 with a CAGR of 5.6% during review period.

Hyperspectral imaging, like other spectral imaging, collects and processes information from across the electromagnetic spectrum. The goal of hyperspectral imaging is to obtain the spectrum for each pixel in the image of a scene, with the purpose of finding objects, identifying materials, or detecting processes. There are two general branches of spectral imagers. There are push broom scanners and the related whisk broom scanners, which read images over time, and snapshot hyperspectral imaging, which uses a staring array to generate an image in an instant.

In 2018, North America is expected to account for the largest share of the global market. However, the Asia-Pacific region is expected to grow at the highest CAGR during the forecast period. The market for hyperspectral imaging systems is expected to grow in emerging economies in APAC as they have a growing number of manufacturing bases. These cameras are used for homeland surveillance, spaceborne applications, agriculture and mineral surveillance, and other research activities requiring constant spectral vigilance.
