Abstracts

Hypogammaglobulinemia is a type of immune disorder that is characterized by insufficient production of gamma globulins in human blood. It causes decline in the antibody count and therefore affects the immune system. Antibodies play a major role in fighting against any foreign and invade particles without antibodies. The incidence rate of hypogammaglobulinemia can be observed in both female and males and cause severe complications. The most common symptoms include bronchitis, skin infection, sinus infections, ear infections, malabsorption, and respiratory infections.

This report studies the global Hypogammaglobulinemia Drugs production, demand, key manufacturers, and key regions.
