## Abstracts

According to our (Global Info Research) latest study, the global IC Card Prepaid Gas Meter market size was valued at US\$ 4412 million in 2025 and is forecast to a readjusted size of US\$ 5911 million by 2032 with a CAGR of 4.2% during review period.

IC card prepaid gas meters are intelligent prepaid metering instruments designed for gas utility billing and end-user gas consumption management. They are typically based on diaphragm gas meters, commercial flow meter bases, or other gas metering units, and integrate IC card reading and writing modules, low-power controllers, valve actuators, LCD displays, balance storage, alarm protection, and data encryption mechanisms. These meters enable gas credit writing, card-based valve opening, consumption deduction, balance reminders, shutoff upon arrears or credit depletion, and abnormal status recording. This product category mainly addresses the high costs associated with traditional manual meter reading, postpaid billing, arrears collection, and household access management. Through one-card-one-meter binding, independent keys, anti-copying protection, magnetic interference resistance, low-voltage detection, tiered gas pricing, and pre-shutoff strategies, it improves billing security, metering controllability, and user service efficiency. Typical applications include residential gas users, villas and small commercial users, industrial and mining enterprises, urban pipeline natural gas, liquefied petroleum gas, town gas, and selected overseas prepaid energy markets.

IC card prepaid gas meters are positioned within the gas metering system as prepaid control terminals between traditional mechanical gas meters and fully connected smart gas meters. They retain the basic metering capability of diaphragm meters or commercial flow meter bases, while integrating gas purchase, balance writing,

consumption deduction, and valve opening and closing into a single meter through IC cards, controllers, valves, display units, and security authentication mechanisms. For gas utilities, the value of these products is mainly reflected in prepaid billing, reduced arrears, lower frequency of household meter reading, and improved user account management efficiency. For end users, functions such as balance display, alarm volume, pre-shutoff, and low-voltage reminders improve gas consumption visibility and payment reminder capability. As requirements for residential gas safety management and tiered gas pricing continue to increase, IC card prepaid gas meters are no longer merely early-stage prepaid devices, but utility metering terminals with account binding, abnormal condition protection, data return, and multi-scenario adaptability.

From a technical structure perspective, competition in IC card prepaid gas meters is concentrated on metering stability, card-reading reliability, valve control safety, low-power design, and anti-tampering capability. Residential products place greater emphasis on integrated appearance, front card insertion, low static power consumption, low-balance alarms, and shutoff at zero balance, making them suitable for residential communities and distributed users. Commercial and industrial products place greater emphasis on built-in valves, large-flow adaptability, maximum gas purchase limits, pre-shutoff parameters, and tiered tariff models, making them suitable for shops, villas, industrial and mining enterprises, and key utility customers. Some products have already added Bluetooth, LoRa, NB-IoT, GPRS, and other communication capabilities, allowing meters to gradually evolve from standalone prepaid terminals into hybrid smart meters that can be incorporated into back-end systems. This trend will not completely replace IC card media; instead, it allows the advantages of IC cards in offline operation, cash payment, distributed regions, and prepaid management to complement remote meter reading, remote valve control, and platform-based operation and maintenance.

From a regional landscape perspective, Chinese companies cover a broad range of officially verifiable IC card prepaid gas meter samples, including residential IC card gas meters for household users and commercial and industrial card meters for business and industrial users, while also forming supporting capabilities in meters, controllers, valves, gas vending systems, and billing platforms. European company samples place greater emphasis on standards compliance, compatibility with multiple gas media, and encrypted IC card data carriers, making them suitable for markets with higher requirements for metrological certification and utility regulations. Future industry growth will mainly come from three types of demand: replacement and upgrading of existing mechanical meters and early-generation card meters, gas utilities' continued demand for arrears control, tiered tariffs, and refined user management, and procurement

demand in overseas prepaid energy markets for low-cost, low-maintenance, offline-capable meters. Overall, IC card prepaid gas meters will maintain stable market space outside fully connected meters and continue to upgrade toward communication extensions, safety protection, and multi-scenario adaptability
