Abstracts

The global Ice Rink Liner market size is expected to reach \$ 109 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

In 2025, the global production of ice rink liner will be approximately 9.5 million square meters, with an average selling price of about 8 US dollars per square meter, a gross profit margin of about 40%, and a single production line capacity of approximately 150,000 square meters per year. Ice rink liner is a high-strength, leak-proof, flexible material layer used in artificial refrigeration ice rinks. They are laid on top of the ice rink's base layer (such as a concrete or sand base), and their main function is to form a waterproof barrier, trapping water used by the refrigeration pipes and ice layer, preventing it from leaking into the base structure. The upstream of the ice rink lining industry is the chemical industry, which provides high-molecular raw materials such as HDPE and additives; the midstream consists of professional lining manufacturers responsible for processing them into rolls and completing welding and laying; and the downstream directly serves ice rink contractors and operators. The core demand stems from the global popularization of winter sports (such as ice hockey and figure skating), the construction and renovation of commercial and public winter entertainment facilities (such as seasonal ice rinks and snow parks), and the construction of multi-functional venues.

The core driving factors of the global ice rink liner market can be summarized into four points: First, the 'massification' of winter sports in North America and Europe and the 'boom' of temporary ice rink scenarios have led to a significant increase in the demand for quickly set up mobile ice rinks in communities, commercial complexes, and hotel resorts. This has pushed the padding market to shift from permanent venues to low-cost, portable temporary scenarios. Second, the technological upgrade of polyethylene

(PE) composite materials has resulted in customized padding that is thicker, puncture-resistant, and resistant to low-temperature cracking, solving the problems of traditional products' leakage and short lifespan, significantly reducing the maintenance costs and insurance risks for ice rink operators. Third, the cost competition between artificial ice sheets and real ice rinks has led to the 'true ice + isolation membrane' solution outperforming simulation ice in terms of experience, attracting high-end commercial complexes to return to the real ice track. Fourth, China's ice and snow industry policies and export benefits have driven the construction of small and medium-sized ice rinks in South China and East China. At the same time, the industrial belts in Shandong and Zhejiang have taken on North American brand OEM orders at extremely low mold costs, becoming the core production capacity of the global padding supply chain.
