## Abstracts

According to our (Global Info Research) latest study, the global ICIs for Cervical Cancer market size was valued at US\$ 804 million in 2024 and is forecast to a readjusted size of USD 1132 million by 2031 with a CAGR of 5.0% during review period.

Immune checkpoint inhibitors (ICIs) for cerv cancer are a class of immunotherapy drugs designed to enhance the body's immune response against cancer cells. These drugs work by blocking specific proteins that cancer cells use to evade immune detection. In the case of cervical cancer, ICIs target checkpoint proteins like PD-1 (programmed cell death protein 1) or PD-L1 (programmed death-ligand 1). By inhibiting these interactions, ICIs help restore the immune system's ability to recognize and destroy cancer cells.
