## Abstracts

According to our (Global Info Research) latest study, the global Idea and Innovation Management Software market size was valued at US\$ 989 million in 2025 and is forecast to a readjusted size of US\$ 2161 million by 2032 with a CAGR of 12.1% during review period.

Idea and Innovation Management Software is a type of digital platform for enterprises, designed to systematically manage the entire process of ideas, concepts, and innovation opportunities, from collection and screening to execution and implementation. Its main functions include idea solicitation, review and prioritization, innovation project initiation, resource allocation, project management, and value measurement and review of innovation outcomes. This type of software helps organizations transform fragmented creative activities into actionable innovation pipelines, supports cross-departmental collaboration, and improves the efficiency and transparency of innovation project execution. Idea and innovation management software typically integrates idea pools, review workflows, innovation portfolio management tools, stage gate management, and risk control mechanisms to ensure the visibility and compliance of the innovation process. Furthermore, this type of software often combines data analytics and artificial intelligence to help enterprises screen potential projects from a vast pool of ideas and continuously optimize the innovation process through real-time data tracking and feedback mechanisms. Compared to traditional idea management tools, idea and innovation management software places greater emphasis on strategic management of innovation and end-to-end execution tracking. The gross profit margin for idea and innovation management software is projected to be approximately 54%-68% by 2025.

Idea and Innovation Management Software is evolving from a standalone idea-gathering tool into a core platform encompassing innovation governance. Against the backdrop of macroeconomic uncertainty and growth pressures, companies are increasingly shifting innovation from fragmented activities to quantifiable portfolio management: on the one hand, this allows them to justify innovation investment even when budgets are tight; on the other hand, it enables them to quickly adjust project priorities and resource allocation when shifting strategies. Simultaneously, the digitalization of R&D and products, along with the widespread adoption of collaborative office tools, has lowered the barriers to cross-departmental collaboration, promoting the online and standardized development of innovation processes; this trend is even more pronounced in industries with higher compliance and traceability requirements, such as manufacturing, pharmaceuticals, finance, and the public sector. Future growth will be primarily driven by three types of changes: First, increased governance demands require companies to unify and consolidate ideas, needs, technological trends, and external ecosystem clues, forming an auditable decision-making chain. Second, the integration of data and AI capabilities is deepening, with platforms creating reusable models and templates for review prioritization, portfolio optimization, risk warning, and value tracking, thereby shortening the cycle from idea to project initiation. Third, deeper integration with existing systems is occurring, with innovation platforms connecting with project management, R&D processes, collaboration suites, and data platforms, making innovation operations more like an end-to-end production line rather than a series of workshops and spreadsheet compilations. Simultaneously, the market faces challenges in implementation and value proof: the difficulty in innovation management often lies not in feature stacking, but in the reconstruction of organizational mechanisms and indicator systems. Without high-level guidance, clear review standards, and resource pool rules, platforms can easily become mere idea repositories. On the vendor side, it is necessary to balance the cost structure of product standardization with industry-differentiated delivery, avoiding diluting software gross margins due to excessive customization and consulting. Downstream demand will lean more towards SaaS solutions that can be quickly deployed and configurable workflows, and will place more specific demands on security, data residency, and access control.
