The global Identity Lifecycle Management market size is expected to reach \$ 450 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

Identity Lifecycle Management refers to a systematic management system for the creation, maintenance, monitoring, and final archiving of digital identities within an enterprise or system. It covers the entire process from identity creation, use, auditing to revoke. Its core objective is to ensure, through automation and policy-driven approaches, that the right people have the right access at the right time, while meeting security and compliance requirements, preventing abuse of access and data breaches, and improving management efficiency and user experience. This process applies to various entities, including employees, partners, customers, and even machine identities. The development of global Identity Lifecycle Management exhibits significant regional differences and driving forces. The North American market is the most mature, driven by stringent compliance requirements and complex enterprise IT environments, with its product systems deeply integrated with the 'zero trust' concept. The European market is also mature, but under the strong constraints of data protection regulations, its solutions particularly emphasize privacy compliance and refined governance. The Asia-Pacific region is the fastest-growing market, with digital transformation and the construction of digital identity systems in countries like China driving explosive demand, focusing on efficient integration and massive identity processing. Overall, the technology paradigm is led by mature markets, while the large-scale and scenario-based applications in emerging markets are injecting new momentum into global practices.
