According to our (Global Info Research) latest study, the global Idhifa market size was valued at USD 81 million in 2023 and is forecast to a readjusted size of USD 127.6 million by 2030 with a CAGR of 6.8% during review period.

Idhifa is a drug used to treat relapsed or refractory acute myeloid leukemia in people with specific mutations of the isocitrate dehydrogenase 2 (IDH2) gene, determined by an FDA-approved IDH2 companion diagnostic test

Enasidenib is a targeted therapy used to treat relapsed or refractory acute myeloid leukemia (AML) with an IDH2 mutation. Its efficacy in inhibiting the mutated IDH2 enzyme and inducing remission has driven market growth. The limited treatment options for this specific subset of AML contribute to its niche status. However, challenges include potential side effects and the need for genetic testing to identify eligible patients. The market competition is relatively small, as Enasidenib remains a targeted therapy for a specific AML subgroup. Despite challenges, the Enasidenib market offers potential for growth as healthcare providers seek effective treatments for patients with IDH2-mutated AML. Continued research and clinical advancements can further drive market expansion.
