Abstracts

The global IGZO Targets for Flat Panel Displays market size is expected to reach $ 81.25 million by 2032, rising at a market growth of 6.1% CAGR during the forecast period (2026-2032).

IGZO targets for flat-panel displays are high-purity ceramic sputtering targets composed primarily of indium (In), gallium (Ga), and zinc (Zn) oxides. They are primarily used in the manufacture of TFT backplanes for LCD, OLED/AMOLED, and other next-generation display panels. Through magnetron sputtering, these targets deposit IGZO oxide semiconductor thin films onto glass or other substrates, serving as the active channel layer for thin-film transistors (TFTs). Compared to traditional amorphous silicon materials, IGZO offers higher carrier mobility, lower leakage current, and superior large-area uniformity. These properties help enhance the resolution, refresh rate, and energy efficiency of display panels, making IGZO widely used in products such as high-end televisions, monitors, laptops, tablets, smartphones, and micro-displays.
