Abstracts

According to our (Global Info Research) latest study, the global IGZO Targets for Flat Panel Displays market size was valued at US$ 54.97 million in 2025 and is forecast to a readjusted size of US$ 81.25 million by 2032 with a CAGR of 6.1% during review period.

IGZO targets for flat-panel displays are high-purity ceramic sputtering targets composed primarily of indium (In), gallium (Ga), and zinc (Zn) oxides. They are primarily used in the manufacture of TFT backplanes for LCD, OLED/AMOLED, and other next-generation display panels. Through magnetron sputtering, these targets deposit IGZO oxide semiconductor thin films onto glass or other substrates, serving as the active channel layer for thin-film transistors (TFTs). Compared to traditional amorphous silicon materials, IGZO offers higher carrier mobility, lower leakage current, and superior large-area uniformity. These properties help enhance the resolution, refresh rate, and energy efficiency of display panels, making IGZO widely used in products such as high-end televisions, monitors, laptops, tablets, smartphones, and micro-displays.
