According to our (Global Info Research) latest study, the global IL-23p19 Inhibitors market size was valued at US\$ 21070 million in 2025 and is forecast to a readjusted size of US\$ 56920 million by 2032 with a CAGR of 15.4% during review period.

IL-23p19 inhibitors are a class of drugs that work by inhibiting the biological activity of Interleukin-23 (IL-23). IL-23 is a cytokine composed of two subunits, p40 and p19, of which p19 is the specific subunit of IL-23. The mechanism of action of IL-23p19 inhibitors is to prevent IL-23 from binding to its receptor by specifically binding to the p19 subunit of IL-23, thereby disrupting IL-23-mediated signaling pathways and reducing the production of inflammatory factors, such as IL-17, IL-22 and GM-CSF. These factors play an important role in chronic inflammatory diseases.
