According to our (Global Info Research) latest study, the global Imaginary Distance Measuring Instrument market size was valued at US\$ 427 million in 2025 and is forecast to a readjusted size of US\$ 684 million by 2032 with a CAGR of 7.0% during review period.

Imaginary Distance Measuring Instrument is a precision measuring instrument specifically designed for the development, production, and quality inspection of virtual reality (VR) and augmented reality (AR) devices. VR and AR devices present virtual images to users through optical systems, and virtual image distance refers to the distance between the plane where the virtual image is perceived by the user's eyes and their eyes. The virtual image distance measuring instrument uses advanced optical measurement principles and technologies to accurately determine the distance value, ensuring that the virtual images presented by VR and AR devices are in the appropriate spatial position, providing users with a natural, comfortable, and ergonomic visual experience, while ensuring that the optical performance of the equipment meets design standards and quality requirements.
