According to our (Global Info Research) latest study, the global Imaging Radiometer market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Imaging radiometer is a device that uses the infrared (IR) band of electromagnetic radiation to detect and analyze the radiometric temperature and spectral radiance of the target.

The increasing in activities of precision agriculture is one of the primary factors that will trigger the growth of the imaging radiometer market in the coming years. The growing demand for food production is a result of the increased population worldwide. To feed the rising population, it is essential to prepare the soil, plant, and harvest the farms at the right time. Moreover, monitoring the changing climatic condition is necessary to enhance the food production and help the farmers. Imaging radiometers are considered useful for this purpose as it helps in monitoring crops, forests, and eco-systems persistently for the subtle changes in the visible and NIR radiation.
