Abstracts

The global Immersion Liquid Cooling Servers market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

There are currently two main types of liquid-cooled servers in the market: immersion liquid-cooled servers and plate-type liquid-cooled servers. The biggest difference between the two is that the CPU, which generates the most heat, in the plate-type liquid-cooled server does not directly contact the cooling liquid. Instead, the liquid is infused into a conductive device, and the CPU end is in contact with the conductive device, and the heat is taken away through the conductive device to achieve cooling. This technology has lower cost and technical requirements compared to immersion liquid-cooled servers, so it is more widely used globally. The immersion liquid-cooled server fully submerges the server in a medium for cooling. There are two types of cooling mediums: air-cooling and liquid-cooling, with liquid-cooling having three sub-types: water, mineral oil, and electronic fluorine.

Water: has a high heat capacity and is non-polluting, but it is not an insulator and can only be used in non-direct contact liquid cooling technology.

Mineral oil: is a relatively inexpensive insulating cooling liquid. Single-phase mineral oil is odorless, non-toxic, and not easily volatile. It is an environmentally friendly medium, but it has a high viscosity and is prone to residue, which can pose a fire risk under certain conditions.

Fluorine-based liquid: due to its insulating and non-combustible inert characteristics, it will not affect the equipment in any way and is the most widely used immersion cooling liquid.

This report studies the global Immersion Liquid Cooling Servers production, demand, key manufacturers, and key regions.
