According to our (Global Info Research) latest study, the global Immersion Transducer market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

An Immersion Transducer is a type of ultrasonic transducer used in immersion testing, a non-destructive testing method. It consists of a piezoelectric crystal or a magnetic material that converts electrical energy into ultrasonic waves, and it is immersed in a liquid couplant to transmit and receive these waves. The transducer is designed with an acoustic impedance similar to the liquid couplant to maximize the transmission of ultrasonic waves into the test material and minimize reflections. Immersion transducers are commonly used for high-resolution ultrasonic inspections of materials such as metals, composites, and ceramics for flaw detection, thickness measurement, and material characterization.
