Abstracts

The global Immersion Transducer market size is expected to reach $ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

An Immersion Transducer is a type of ultrasonic transducer used in immersion testing, a non-destructive testing method. It consists of a piezoelectric crystal or a magnetic material that converts electrical energy into ultrasonic waves, and it is immersed in a liquid couplant to transmit and receive these waves. The transducer is designed with an acoustic impedance similar to the liquid couplant to maximize the transmission of ultrasonic waves into the test material and minimize reflections. Immersion transducers are commonly used for high-resolution ultrasonic inspections of materials such as metals, composites, and ceramics for flaw detection, thickness measurement, and material characterization.

This report studies the global Immersion Transducer production, demand, key manufacturers, and key regions.
