According to our (Global Info Research) latest study, the global Immune Checkpoint Inhibitors for Cancer market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Immune checkpoint inhibitors are a class of therapeutic agents designed to enhance the body's immune response against cancer cells. They work by blocking specific proteins on immune cells or cancer cells that inhibit immune activation, effectively unleashing the immune system to recognize and attack tumors. Common targets for these inhibitors include programmed cell death protein 1 (PD-1), programmed cell death ligand 1 (PD-L1), and cytotoxic T-lymphocyte-associated protein 4 (CTLA-4). By preventing these checkpoints from dampening the immune response, immune checkpoint inhibitors have shown significant efficacy in treating various cancers, leading to improved survival rates and long-term remissions in some patients.
