Abstracts

Immunofluorescence is the specific antigen and antibody reaction where the antibodies are labeled with a fluorescent dye and the antigen-antibody complex is visualized using fluorescent (UV) microscope. Some of the commonly used fluorochromes include Acridine Orange, Lissamine, Rhodamine, and Calcofluor white. Various factors determine the type of immunofluorescence assay used such as time consumed, cost, complexity, flexibility, sensitivity, cross reactivity and many others. It is used in all disciplines of biology including medicine for diagnostics and research.

Immunofluorescence assays are used to detect specific proteins in cells that may be in specimen, in culture, in tissues, on microbeads and microarrays, etc.
