Abstracts

According to our (Global Info Research) latest study, the global Immunoepitome Profiling market size was valued at US\$ 437 million in 2025 and is forecast to a readjusted size of US\$ 759 million by 2032 with a CAGR of 8.3% during review period.

The immunoepitome refers to the study of all peptides presented by nucleated cells on MHC-Class I or II proteins (Major Histocompatibility Complex, also known as the major histocompatibility complex, such as the expression product of human MHC, HLA, Human Leukocyte Antigen) involved in the antigen presentation pathway, and is essential for the investigation of immunogenic epitopes in cell-mediated and humoral responses. Immunoepitome profiling is the study of the dynamics and composition of class I and II immune peptides, enabling not only the discovery of targets for personalized cancer immunotherapy (such as neoantigens from tumor-specific mutations or tumor-associated antigens), but also contributes to new mRNA/polypeptide vaccines and immune cell therapy.
