Abstracts

The global Immunotherapy Products market size is expected to reach \$ 404701 million by 2032, rising at a market growth of 5.8% CAGR during the forecast period (2026-2032).

Immunotherapy products refer to a broad class of biopharmaceuticals that prevent or treat diseases by activating, suppressing, or modulating the human immune system. This category includes therapeutic and prophylactic vaccines, antibody therapeutics, antibody-drug conjugates (ADCs), cell therapies such as CAR-T, peptide therapeutics, and various immunomodulators, with major applications in oncology, autoimmune and inflammatory diseases, and selected infectious diseases. From an industry perspective, immunotherapy is characterized by high technological barriers, long development cycles, and stringent regulatory requirements, but also by strong pricing power and relatively long commercial lifecycles once products are approved. On the supply side, the average gross margin of leading global companies' immunotherapy-related businesses in 2025 is generally estimated to be in the range of approximately 65%–80%, with variations driven by modality mix, manufacturing strategy (in-house versus outsourced), competitive intensity, and regional pricing dynamics.
