Abstracts

Immunoturbidimetry is a dynamic assay method for antigen-antibody binding. The basic principle is: when the antigen and antibody react in a special dilution system and the ratio is appropriate, they will precipitate from the liquid phase to form particles, which will make the reaction liquid appear turbid. When the antibody concentration is fixed, the amount of the formed immune complex increases with the increase in the amount of antigen in the test sample, and the turbidity of the reaction solution also increases. By measuring the turbidity of the reaction solution and comparing it with a series of standard substances, the content of the antigen in the test sample can be calculated. Immunoturbidimeters are diagnostic reagents used in immunoturbidimetry.

This report studies the global Immunoturbidimetry Reagents production, demand, key manufacturers, and key regions.
