Abstracts

The Impermeable Castable has the characteristics of high strength, low thermal conductivity, and strong penetration resistance, which can prevent the penetration, erosion, and clustering of molten aluminum to prolong the service life of the electrolytic cell, and at the same time prevent the electrolyte from entering the refractory insulation layer. The increase of its thermal conductivity leads to an increase in the power consumption of the electrolyzer. The anti-seepage material is quick and convenient to construct, and can heat up quickly without baking. It is mainly used for the bottom of the electrolytic cell to replace the refractory brick layer as the anti-seepage layer.

This report studies the global Impermeable Castable production, demand, key manufacturers, and key regions.
