Abstracts

The global Implantable Cardiac Resynchronization Therapy Equipment market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Heart failure is a complex disease that often requires multiple treatments to work together. Although drug treatment is the most common treatment method, there are still many patients who rely solely on drug treatment for poor results and cannot prevent the disease from getting worse. In order to obtain more effective treatment, doctors usually recommend that patients install an implantable cardiac resynchronization therapy (CRT) device, coupled with drug treatment, which can effectively slow down the development of heart failure and achieve a 'two-pronged approach'!
