According to our (Global Info Research) latest study, the global Implantable Sacral Nerve Electrical Stimulator market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The implantable sacral nerve electrical stimulator is a medical device used to treat urinary incontinence and defecation dysfunction caused by neurogenic bladder, spinal cord injury, multiple sclerosis, etc. It stimulates the sacral nerves by sending electrical pulses to regulate nerve activity and improve the function of the bladder and anal sphincter, thereby improving the patient's urination and defecation problems.

The working principle of the sacral nerve electrical stimulator is to implant electrodes into the sacral nerve position, use weak electric pulses to stimulate the sacral nerves, and regulate nerve reflexes such as the bladder, urethral sphincter, anal sphincter, and pelvic floor, so that the nerves that control urination and defecation can be accurately directed. The brain sends 'on' and 'off' signals, ultimately improving disease symptoms.
