In-building coverage refers to the provision of reliable wireless communication services inside buildings, ensuring that users can maintain consistent mobile signal strength for voice, data, and other wireless communications. This is achieved through specialized systems like Distributed Antenna Systems (DAS) and Bi-Directional Amplifiers (BDAs), which are designed to enhance cellular and public safety signals in areas where outdoor signals may not be strong enough or are obstructed by building materials.

These systems are essential for large or complex buildings, underground spaces, or areas with poor or no signal penetration. Both DAS and BDAs provide in-building coverage, but they serve different purposes and are used in different scenarios.
