## Abstracts

According to our (Global Info Research) latest study, the global In-kind Carbon Credit Insurance market size was valued at US\$ 28.00 million in 2025 and is forecast to a readjusted size of US\$ 90.92 million by 2032 with a CAGR of 18.3% during review period.

In-kind Carbon Credit Insurance is a risk transfer tool covering the entire lifecycle of carbon credits. Its core purpose is to transform uncertain losses in carbon credit trading and compliance into quantifiable and payable insurance liabilities at a fixed premium. It typically covers key risks faced by enterprises or financial institutions when purchasing, holding, or financing carbon credits in voluntary carbon markets and other scenarios. These risks include non-delivery of carbon credits, project or credit revocation or invalidation, carbon sink reversal due to natural disasters or management issues, and credit failure caused by fraud or compliance flaws. Products can cover buyers, sellers, and intermediaries, and can be designed according to the transaction stage, providing investment protection before delivery, validity and reversal protection after delivery, or tied to financing structures to improve financing availability and delivery certainty. The global In-kind Carbon Credit Insurance gross margin is projected to be approximately 25.2% in 2025.

Carbon credit insurance is becoming a key infrastructure for the scaling up of high-quality voluntary carbon markets. In 2025, the voluntary carbon market showed signs of recovery in both value and write-off volume. Trading participants became increasingly sensitive to delivery certainty, credit quality, and reputational risk, rapidly making the need to 'price and transfer uncertainty' more apparent. For buyers, insurance can lock in delivery and compliance outcomes within a controllable budget, reducing the costs and

disclosure risks of secondary procurement due to reversals or invalidities. For sellers and project developers, insurance helps improve the acceptability and financing availability of forward contracts, breaking down project risks into insurable and capital market-understandable elements. For financial institutions and platforms, insurance can serve as a credit enhancement tool in transaction matching and assetization structures, driving carbon credits from one-off purchases to more standardized long-term contracts and portfolio management. The main bottlenecks in this market lie in data and liability boundaries. Carbon credit risk stems from complex sources, including natural disasters and project operational fluctuations, as well as methodological changes, adjustments to registration rules, and differences in third-party verification. This easily creates long-tail risks that are difficult to price in a homogeneous manner. Furthermore, compensation can take the form of cash payments or credit replenishment, placing higher demands on insurers' reinsurance arrangements, reserve asset management, and liquidity. As high-quality credit premiums widen and buyers shift from single purchases to annual portfolio management, demand will favor products with quantifiable triggers, coverage of multi-year compliance windows, and embeddability in trading platforms and financing terms. On the supply side, institutions with professional underwriting capabilities, risk models, and cross-market reinsurance capacity will have greater bargaining power, and the market will gradually transition from 'customized individual cases' to a scaled-up stage of 'replicable terms plus rating data.'
