The global In-Line Particle Sensor market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

An in-line particle sensor is a device used to detect and measure particulate matter in the air. It can monitor the concentration and size distribution of particulate matter in the air in real time, including fine particulate matter (PM_{2.5}) and respirable particulate matter (PM₁₀). Inline particle sensors typically use optical principles or laser light scattering techniques to measure particle concentration and size. These sensors can be widely used in indoor air quality monitoring, environmental monitoring, industrial production process monitoring and other fields.
