Abstracts

According to our (Global Info Research) latest study, the global In Line Process Viscometer (ILPV) market size was valued at USD 107.7 million in 2023 and is forecast to a readjusted size of USD 148.5 million by 2030 with a CAGR of 4.7% during review period.

A viscometer (also called viscosimeter) is an instrument used to measure the viscosity of a fluid. For liquids with viscosities which vary with flow conditions, an instrument called a rheometer is used. Thus, a rheometer can be considered as a special type of viscometer. Viscometers only measure under one flow condition.

First of all, the increasing demand for in line process viscometer drives the market size. Second, expansion of refining industry capacities owing to growing energy needs followed by regulatory emission norms in the oil and gas sector are key factors driving the global in-line process viscometer market demand. Additionally, the price of installing an in-line process viscometer is just 1/4th to that of the cost obtained during repairing breakdown or maintenance of the instrument. Correct control of fuel viscosity is believed to be a vital component in the automobile market, and ILPV manages fuel fragmentation, favorable for proficient combustion and thus is acquiring approval in automobile industry around the world. APAC, with India and China industrial sector growth, was the dominant regional industry. Indian and Chinese governments have framed favorable FDI policies intended to enhance petroleum and petrochemical production in the country. The policies may facilitate new investments in the refining sector thereby driving stimulating ILPV market size.
