## Abstracts

According to our (Global Info Research) latest study, the global In-memory Computing market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

In-memory computing is the storage of information in the main random access memory (RAM) of dedicated servers rather than in complicated relational databases operating on comparatively slow disk drives. In-memory computing helps business customers, including retailers, banks and utilities, to quickly detect patterns, analyze massive data volumes on the fly, and perform their operations quickly. The drop in memory prices in the present market is a major factor contributing to the increasing popularity of in-memory computing technology. This has made in-memory computing economical among a wide variety of applications.

The In-Memory Computing Market has seen rapid adoption across verticals such as Banking, Financial Services, and Insurance (BFSI), IT & telecom, government, and retail, which has led to rapid growth of the market globally. IMC has a wide scope and finds acceptability across all verticals. Enterprises across all the verticals generate data and there is increased need to manage this organizational data to streamline business processes and achieve strategic initiatives.

The Global Info Research report includes an overview of the development of the In-memory Computing industry chain, the market status of BFSI (Relational Database, NoSQL), Retail (Relational Database, NoSQL), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of In-memory Computing.
