## Abstracts

According to our (Global Info Research) latest study, the global In-Memory Database market size was valued at USD 3480.1 million in 2023 and is forecast to a readjusted size of USD 9217.3 million by 2030 with a CAGR of 14.9% during review period.

An in-memory database is a database management system that primarily relies on main memory for computer data storage. It is contrasted with database management systems that employ a disk storage mechanism. In-memory databases are faster than disk-optimized databases because disk access is slower than memory access, the internal optimization algorithms are simpler and execute fewer CPU instructions. Accessing data in memory eliminates seek time when querying the data, which provides faster and more predictable performance than disk.

The market in North America is expected to hold the largest share of the market. The APAC region is projected to have great opportunities in this market and would grow at the highest CAGR by 2023.
