In Situ Hybridization (ISH)

Scope of the Report:

In Situ Hybridization (ISH) is a technique that allows for precise localization of a specific segment of nucleic acid within a histologic section.

The underlying basis of ISH is that nucleic acids, if preserved adequately within a histologic specimen, can be detected through the application of a complementary strand of nucleic acid to which a reporter molecule is attached.

Visualization of the reporter molecule allows to localize DNA or RNA sequences in a heterogeneous cell populations including tissue samples and environmental samples.

Riboprobes also allow to localize and assess degree of gene expression. The technique is particularly useful in neuroscience.

The worldwide market for In-Situ Hybridization is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
