Abstracts

According to our (Global Info Research) latest study, the global In-Vehicle Video Surveillance System market size was valued at US\$ 16315 million in 2025 and is forecast to a readjusted size of US\$ 27957 million by 2032 with a CAGR of 8.4% during review period.

In-Vehicle Video Surveillance System is a video surveillance solution specifically designed for mobile vehicle environments. By integrating audio and video encoding/decoding technologies, wireless network communication technologies, global positioning systems (GPS), and GIS geographic information technologies, it enables real-time acquisition, storage, transmission, and analysis of information regarding the vehicle's internal and external environments and its operational status during driving and operation. The system typically consists of a three-tier architecture: an in-vehicle terminal, a wireless transmission network, and a central management platform. The in-vehicle terminal (i.e., an in-vehicle DVR or MDVR) serves as the core hardware, integrating GPS satellite positioning and 4G/5G wireless network transmission capabilities in addition to traditional recording functions. The wireless transmission network is responsible for transmitting the acquired audio and video data back in real time. The central management platform enables centralized monitoring, dispatching, and command of all connected vehicles.

In-Vehicle Video Surveillance System not only provides real-time wireless transmission of vehicle routes, in-vehicle and external video images, but also offers comprehensive management functions such as vehicle anti-theft, anti-hijacking, rapid accident response, and call command. The system has been widely used in various scenarios, including buses, long-distance coaches, school buses, taxis, logistics vehicles, police

vehicles, escort vehicles, and rail transit.
