Inflammatory bowel disease is a group of medical conditions that causes chronic inflammation in the digestive tract. The inflammatory bowel disease is an umbrella term which comprises two principal disorders: ulcerative colitis and Crohn's disease. Ulcerative colitis is a long-term medical indication that causes inflammation and sores in the inner lining of colon and rectum. Crohn's disease is part of inflammatory bowel disease that causes inflammation to any part of gastrointestinal tract, right from mouth to small intestine and anus. The exact cause of inflammatory bowel diseases is not known; however, autoimmune disorders, genetic factors, and lifestyle changes are thought to cause the symptoms of inflammatory bowel diseases in an individual. Common symptoms of inflammatory bowel diseases include diarrhea, abdominal pain & cramps, constipation, rectal bleeding, weight loss, and fever. Inflammatory bowel diseases (IBD) affect men and women equally and is more commonly observed in developed countries in the West than developing and underdeveloped countries. There is no single test that can diagnose the inflammatory bowel disease. However, the laboratory tests primarily involve blood test, fecal test, and genetic test. The laboratory tests are performed in conjunction with other screening tests such as CT-Scan, colonoscopy, endoscopy, and MRI screening.
