According to our (Global Info Research) latest study, the global In Vivo Optical Imaging Systems market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

In vivo imaging is the non-invasive visualization of living organisms for research or diagnostic purposes. Generally speaking, this method can be divided in two key areas: anatomical/morphological imaging and molecular imaging. In molecular imaging cellular function or molecular processes are visualized, normally using biomarkers. While in anatomical imaging no marker is used and visualization is based on the intrinsic properties of the tissues and organs being observed, such as the attenuation of X-rays in the case of computed tomography, molecular imaging very often uses biomarkers labeled with bioluminescence or fluorescence.
