Abstracts

In vivo toxicology is usually carried out in animals as a whole, so that experimental animals in a certain period of time, according to the actual contact mode of human exposure to a certain amount of foreign compounds, and then observe the animal may appear in the form or function changes. Mammals are commonly used in experiments, such as rats, mice, guinea pigs, rabbits, hamsters, dogs and monkeys. The general toxicity of foreign compounds, such as acute toxicity test, subchronic toxicity test and chronic toxicity test, is usually detected.
