According to our (Global Info Research) latest study, the global Incremental Inductive Encoder market size was valued at US\$ 417 million in 2024 and is forecast to a readjusted size of USD 581 million by 2031 with a CAGR of 5.2% during review period.

The incremental inductive encoder is a position sensor that works on the principle of electromagnetic induction and is used to measure the position change of rotation or linear motion. It generates pulse signals by sensing the changes in the electromagnetic field generated by rotation or linear motion to determine the position, speed and direction. The incremental inductive encoder has the advantages of high precision, strong anti-interference ability and long life, and is widely used in industrial automation, robotics and measuring instruments.
