## Abstracts

The global Indirect Pilot Solenoid Valve market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The indirect pilot solenoid valve is a channel combination formed by connecting the pilot valve and the main valve core, and the normally closed indirect pilot solenoid valve is closed when it is not energized. When the line diagram is energized, the generated magnetic force makes the moving iron core attract the static iron, the pilot valve port opens, and the medium flows to the outlet. At this time, the pressure in the upper chamber of the main diaphragm decreases, lower than the pressure on the inlet side, forming a pressure difference, and moving upward against the resistance of the spring to achieve the purpose of opening the main valve port. Pre-circulation. When the power is off, the spring force opens the pilot hole, and the inlet pressure quickly passes through the bypass hole to form a pressure difference between the lower and upper parts around the valve closing part, and the fluid pressure pushes the opening part to move down to open the valve.
