## Abstracts

According to our (Global Info Research) latest study, the global Indium For Targets market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Indium is a heavy metal element commonly used in target preparation, especially in fields such as nuclear medicine and X-ray diffraction. Indium targets generally have high density and good absorption properties, making them excellent in the absorption of X-rays and gamma rays. This makes indium targets an important material for the production of medical radioisotopes, X-ray tubes, and for materials analysis and structural characterization. Indium targets are usually prepared in the form of high-purity indium metal or indium compounds, and then processed into targets of the desired shape and size by pressing, hot pressing or other processes. These indium targets provide stable radiation characteristics and are resistant to radiation damage to a certain extent, making them widely used in various nuclear medicine and X-ray applications.
