Abstracts

The global Indium Oxide Powder market size is expected to reach \$ 266 million by 2032, rising at a market growth of 5.6% CAGR during the forecast period (2026-2032). Indium oxide is an oxide with the molecular formula In_2O_3 . The pure product is a white or light yellow amorphous powder, which turns reddish brown when heated. Indium oxide is a new n-type transparent semiconductor functional material with a wide bandgap, low resistivity, and high catalytic activity. It has been widely used in the fields of optoelectronics, gas sensors, and catalysts. In 2024, global Indium Oxide Powder production reached approximately 272 MT, with an average global market price of around US\$ 650 per kg.

The main line on the demand side is still the ITO transparent conductive system, and display and touch are still the largest consumption scenarios. The industry boom is more like fluctuating with the panel and terminal electronics cycles, rather than going independently. The growth comes from the application spillover of transparent conductive films, such as wearable and flexible terminals, as well as some energy-saving glass and new transparent electronic directions, which means that there is a stronger structural demand for high-purity powders and controllable particle size morphology. The core constraint on the supply side is that indium is an associated metal, the supply elasticity is weak and the price is easy to fluctuate. Therefore, the profit elasticity of indium oxide powder depends largely on the upstream indium price and spot tightness. The product side will continue to diverge into two ends. Target-grade and electronic-grade high-purity powders emphasize low impurity spectra and batch consistency, while industrial-grade powders place more emphasis on cost-effectiveness and stable delivery, resulting in an obvious multi-level price system. The risk of substitution exists for a long time. Solutions such as silver nanowires, metal meshes and conductive polymers will divert demand in some scenarios. However, under the requirements of high reliability and mature mass production yield, ITO is still

sticky. Therefore, a more realistic path is to reduce the unit indium consumption and improve utilization, rather than completely replacing it.
