## Abstracts

The global Indium Tin Alloy Wire market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Indium is easy to oxidize, and the surface oxide film is very thin, and this oxide film can prevent indium from being further oxidized. After melting, once the oxide film is broken, indium can wet oxide materials such as glass and ceramics because it has extremely low Surface energy can spread on the surface of oxide materials such as glass and ceramics. Although the indium content of indium tin alloy solder does not exceed 20%, this activity can be maintained by adding Zn to ensure the bonding strength and air tightness of the solder.

Indium-tin alloy is a low-temperature eutectic alloy with a melting point of 118°C. It has good ductility, good thermal fatigue resistance, good electrical conductivity, and good wettability to non-metals such as copper plates, glass and ceramics, and can be used as a An excellent special solder, commonly used in microelectronics assembly, glass-glass, glass-metal welding. Silver-tin alloy can also replace silver materials for some special additions, which can significantly reduce the thermal resistance of the material.
